

What videos.insert actually receives

Playtest Recorder makes one API call. Below is the exact request body, captured from the application's own dry-run mode on a real recorded session — not a hand-written example.

The review step, before anything is sent

The application's Publish dialog, captured from its automated UI test. The title and description shown are the real generated text for the session in the request body alongside; the account line and the session list behind it are test fixtures. The user reads and can edit all of this, and picks the visibility, before any request is made.

Where the description comes from. Each timestamp line is one moment the developer marked during their own play session, with the words they dictated at that moment, transcribed on their own machine. Nothing in the metadata is scraped, generated from another channel, or taken from any third party.

Request body (verbatim, from --dry-run)

Endpoints used	youtube.videos.insert — and no others. No search.list, no videos.list, no channel, comment, subscriber or analytics reads.
OAuth scope	https://www.googleapis.com/auth/youtube.upload (single scope, write only)
OAuth client type	Desktop app, installed-app loopback flow (http://127.0.0.1:<port>)
Credential storage	Refresh token cached in the user's own profile at %APPDATA%\playtest-recorder\youtube-token.json. Never transmitted anywhere else; deleted by the app's Sign out.
Upload mechanics	Resumable upload, 8 MiB chunks, one at a time. Never concurrent, never batched, never scheduled or automatic.
Quota	1,600 units per upload. At the requested 16,000 units/day that is ten uploads; peak 3,200 units/minute covers one upload plus one retry.
Default visibility	unlisted (the user may choose private or public)
Servers	None. The application has no backend; the request is made from the end user's own machine with their own credentials.
Privacy policy	https://gw1108.github.io/video-record-plus-notes/privacy
Terms of service	https://gw1108.github.io/video-record-plus-notes/terms-of-service

Who uses it. Playtest Recorder is a desktop tool for a game developer recording their own playtest sessions. One person per installation, uploading their own gameplay recording to their own channel, so that the session can be shared with their team alongside their notes. It reads nothing back from YouTube.
